DET-02

File-Access Route Coverage

Design Assessment & Retest Observations

DOCUMENT INFORMATION	DETAIL
Control area	SUP-03 — Logging, exports, investigation scope and monitoring
Prepared by	Andrew Luke
Version / prepared	1.0 — comparison copy | October 28, 2026
Evidence dates	September 14, November 3 and November 7, 2023; February 8, 2024

1. Assessment Scope

Does the documented DET-02 configuration cover the file-access routes needed to achieve its monitoring objective? This workpaper assesses event-type inclusion at the supplied snapshots and records supporting observations from two approved early-retest cases.

It does not evaluate every aspect of DET-02 design, continuous implementation, or overall SUP-03 effectiveness.

2. Requirement and Evidence

Criterion source: Support_Control_Assessment_v3.xlsx → Control Requirements → SUP-03 → cell F4.

Relevant original wording: “Cover both file event types and identifier semantics” and “Both routes required.” The full DET-02 criterion specifies the fifth successful file download per account within a rolling 60-minute window, resetting after each trigger. Receipt is required within 15 minutes; alerts within 5 minutes of qualifying receipt.

For this scope, compare inclusion of case_attachment.read and file_library.download with the documented event_types values. Listing both types does not itself demonstrate correct cross-route correlation.

3. Risk and Control Objective

Risk: If file-library downloads are excluded from monitoring, high-volume activity through that route may not contribute to the detection threshold or generate an alert. This could delay investigation of unauthorized access to support attachments.

Objective: Detect qualifying successful file-access activity across both the case-view and file-library routes.

4. Design Procedure and Evidence References

Inspect each DET-02 configuration snapshot. Compare its listed event types with the two required event types, recording the date, inclusion or omission, and a conclusion limited to route coverage.

REFERENCE	EVIDENCE / RECORD SELECTION
E-01	Original V3 workbook: Control Requirements, SUP-03, F4.
E-02	detection_configuration.csv: rule_id = DET-02; snapshots 2023-09-14, 2023-11-03, 2024-02-08.
E-03	detection_tests.csv: DTEST-002 and DTEST-003.
E-04	Monitoring_Evidence_Review.xlsx: DET-02 Trigger Results; FILE-00435, FILE-00560 and FILE-00565. Derived analysis output.
E-05	Underlying attachment_access.jsonl, ingestion_events.jsonl and security_alerts.jsonl; retain source records for traceability.

5. Configuration Observations

SNAPSHOT	DOCUMENTED EVENT TYPES	ROUTE-COVERAGE RESULT
Sep 14, 2023	case_attachment.read	Does not meet criterion: file_library.download omitted.
Nov 3, 2023	case_attachment.read; file_library.download	Meets event-type inclusion criterion at this snapshot.
Feb 8, 2024	case_attachment.read; file_library.download	Meets event-type inclusion criterion at this snapshot.

Design assessment: September's documented configuration omits a required route. The later snapshots address this event-type inclusion gap on paper. These records do not establish continuous applied state or correct execution of the complete rule logic.

6. Operating Observations and Approved Retests

These observations supplement the route-coverage assessment; they are not a substitute for evaluating documented design.

PERIOD	EXPECTED TRIGGERS	TIMELY RECEIPTS	MATCHING / TIMELY ALERTS
Incident / discovery	21	21	0 / 0
Early retest	2	2	2 / 2

Incident example: FILE-00435 occurred on September 28, 2023 at 02:06 UTC and matched a receipt at 02:09 UTC. No matching DET-02 alert was found in the supplied evidence. This is an observed alert-evidence gap; its technical cause is not established.

APPROVED TEST	TRIGGER / EVENT TYPE	ALERT / DELAY AFTER RECEIPT
DTEST-002	FILE-00560 case_attachment.read route: case_view	ALERT-002 120 seconds
DTEST-003	FILE-00565 file_library.download route: file_library	ALERT-003 120 seconds

Both November 7 tests met the 300-second alert threshold. They demonstrate successful alert generation in these two cases, not sustained operation over the full period.

7. Conclusion and Limitations

ASSESSMENT CONCLUSION

September: documented route coverage does not meet the stated criterion.

November and February: documented event-type inclusion meets that specific criterion at the supplied snapshot dates.

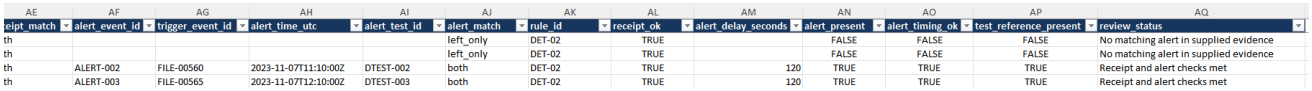

Early retest: both approved cases produced timely alerts; sustained effectiveness is not established.

Limitations: Snapshots are point-in-time evidence. The supplied alerts do not prove that no other alert ever existed. Two positive retests do not establish continuous operation, cross-route correlation in mixed-route cases, correct reset behavior in every scenario, or complete remediation closure. This is not an overall SUP-03 conclusion.

Attribution: Independent simulation using fictional records and exercise thresholds. No Okta affiliation, internal access, or actual-company control finding is claimed.

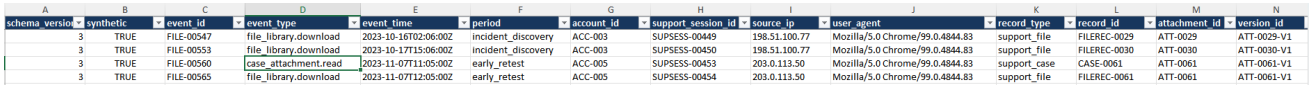

Appendix A. Screenshots Retained from the Draft

The images below are retained from the supplied workpaper for visual comparison. Use the structured evidence references and source records for exact IDs, values and dates; screenshots are supporting illustrations, not the sole evidence trail.
